Cell Growth And Division Section

Cell division and growth. In unicellular organisms, cell division is the means of reproduction; in multicellular organisms, it is the means of tissue growth and maintenance. Survival of the eukaryotes depends upon interactions between many cell types, and it is essential that a balanced distribution of types be maintained. This is achieved by the highly regulated process of cell proliferation.

Cell - Cell division and growth | Britannica

While there are a few cells in the body that do not undergo cell division (such as gametes, red blood cells, most neurons, and some muscle cells), most somatic cells divide regularly. A somatic cell is a general term for a body cell, and all human cells, except for the cells that produce eggs and sperm (which are referred to as germ cells), are somatic cells.

3.5 Cell Growth and Division - Anatomy and Physiology

The cell cycle is an ordered series of events involving cell growth and cell division that produces two new daughter cells. Cells on the path to cell division proceed through a series of precisely timed and carefully regulated stages of growth, DNA replication, and division that produces two identical (clone) cells.

The Cell Cycle | Biology I

•direct cells to speed up or slow down the cell cycle •Growth factors stimulate the growth and division of cells • Growth regulators are important during embryonic development and wound healing • Molecules found on neighboring cells have the opposite effect causing cells to slow down or stop their cell cycles.
