The first true method of DNA profiling was restriction fragment length polymorphism analysis. The first use of RFLP analysis in forensic casework was in 1985 in the United Kingdom. This type of analysis used variable number tandem repeats (VNTRs) to distinguish between individuals. VNTRs are common throughout the genome and consist of the same DNA sequence repeated again and again.

## **Forensic DNA analysis - Federal Defenders NY**

DNA Evidence Overview DNA was first introduced as evidence in the United States court system in 1987. DNA technology has become an increasingly powerful forensic tool for identifying or eliminating individuals as perpetrators of a crime when biological evidence such as saliva, tissue, blood, hair, or semen is left at a crime scene.

## **Forensic DNA Training**

DNA profiling (also called DNA fingerprinting) is the process of determining an individual's DNA characteristics. DNA analysis intended to identify a species, rather than an individual, is called DNA barcoding.. DNA profiling is a forensic technique in criminal investigations, comparing criminal suspects' profiles to DNA evidence so as to assess the likelihood of their involvement in the crime.
