Draw a direction field for the given differential equation. Based on the direction field, determine the behavior of  $y$  as  $t \rightarrow \infty$ . If this behavior depends on the initial value of  $y$  at  $t = 0$ , describe the dependency.  $y' = 3 - 2y$

Differential Equations is a very difficult subject to grasp fully and without the solution manual it is very hard to see how you get the answers. This book fills in the gap. One thing to take note is that the book only shows odd question answers and only answers to medium or hard questions, self-explanatory questions are ignored.

After some essential but elementary ODEs, Fourier series, and Sturm–Liouville problems are discussed briefly, the heat, Laplace, and wave equations are introduced in quick succession as mathematical models of physical phenomena, and then a number of methods (separation of variables, eigenfunction expansion, Fourier and Laplace transformations, and Green's functions) are applied in turn to specific initial/boundary value problems for each of these equations.

Most elementary and special functions that are encountered in physics and applied mathematics are solutions of linear differential equations (see Holonomic function). When physical phenomena are modeled with non-linear equations, they are generally approximated by linear differential equations for an easier solution.
