Inductors are components that are simple in their construction, consisting of coils of insulated copper wire wound around a former that will have some type of core at its centre. This core might be a metal such as iron that can be easily magnetised; or in high frequency inductors, it will more likely to be just air.

A seminal reference for inductance calculation (which, unfortunately is now out of print) is the Frederick Grover book. Professor Grover spent most of his professional life calculating inductance of different kinds of wire loops, and many useful examples and tables are given for loops of interesting shapes and sizes.

Fundamentals of Power Electronics Chapter 14: Inductor design
The window utilization factor K_u also called the "fill factor" K_u is the fraction of the core window area that is filled by copper
Mechanisms that cause K_u to be less than 1:
• Round wire does not pack perfectly, which reduces K_u by a factor of 0.7 to 0.55 depending on winding technique

A few simple formulas can help find design limits and a more comprehensive approach can help the designer establish optimal positions, quantities and sizes for gaps within inductor cores. There are additional benefits that can be realized from this approach, which allow for smaller size and lower costs.
